# PRODUCT INFORMATION

### GIPR Extracellular Domain (human, recombinant; aa 26-138)

Item No. 42230

#### **Overview and Properties**

Synonyms: Gastric Inhibitory Polypeptide Receptor, Glucose-dependent Insulinotropic Polypeptide

Source: Active recombinant human C-terminal His-tagged GIPR extracellular domain expressed

in HEK293 cells

**Amino Acids:** 26-138 P48546 **Uniprot No.:** Molecular Weight: 14.42 kDa

Storage: -80°C (as supplied)

Stability: ≥1 year

**Purity:** ≥95% as determined by SDS-PAGE Lyophilized from sterile PBS, pH 7.4 Supplied in:

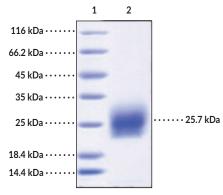

Endotoxin Testing: <1.0 EU/µg, determined by the LAL endotoxin assay

**Protein** 

Concentration: batch specific mg/ml batch specific U/ml Activity: Specific Activity: batch specific U/mg

Information represents the product specifications. Batch specific analytical results are provided on each certificate of analysis.

#### SDS-PAGE Analysis of GIPR Extracellular

**Domain.** This protein has a calculated molecular weight of 14.42 kDa. It has an apparent molecular mass of approximately 25.7 kDa, by SDS-PAGE, under reducing conditions due to glycosylation.

WARNING THIS PRODUCT IS FOR RESEARCH ONLY - NOT FOR HUMAN OR VETERINARY DIAGNOSTIC OR THERAPEUTIC USE.

This material should be considered hazardous until further information becomes available. Do not ingest, inhale, get in eyes, on skin, or on clothing. Wash thoroughly after handling. Before use, the user must review the complete Safety Data Sheet, which has been sent via email to your institution.

WARRANTY AND LIMITATION OF REMEDY

Buyer agrees to purchase the material subject to Cayman's Terms and Conditions. Complete Terms and Conditions including Warranty and Limitation of Liability information can be found on our website.

# **PRODUCT INFORMATION**

bind GIPR Extracellular Domain (human, recombinant; aa

## 26-138), the EC<sub>50</sub> value is 1.5-4.5 ng/ml.

### Description

Glucose-dependent insulinotropic polypeptide receptor (GIPR) is a transmembrane glycoprotein hormone receptor and class B1 G protein-coupled receptor (GPCR). It is composed of an N-terminal extracellular domain required for ligand binding, seven transmembrane domains, and a C-terminal intracellular domain. GIPR is expressed in adipose tissue and the pancreas, gut, heart, pituitary gland, adrenal cortex, and brain and localizes to the plasma membrane. It is involved in insulin and glucagon secretion, bone remodeling, and lipid metabolism, is activated by the endogenous ligands GIP (1-42) and GIP (1-30) amide, and induces primarily  $G\alpha_s$  signaling. Knockout of GIPR increases lipolysis in white adipose tissue and reduces body weight gain and fat mass in a mouse model of obesity induced by a high-fat diet. SNPs in GIPR are associated with type 2 diabetes. Cayman's GIPR Extracellular Domain (human, recombinant; aa 26-138) protein can be used for binding assays. This protein consists of 124 amino acids, has a calculated molecular weight of 14.42 kDa, and a predicted N-terminus of Gly26 after signal peptide cleavage. By SDS-PAGE, under reducing conditions, the apparent molecular mass of the protein is 25.7 kDa due to glycosylation.
